Histological Typing of Bone Tumours (WHO. World Health Organization. International Histological Classification of Tumours)

F. Schajowicz

Histological Typing of Bone Tumours (WHO. World Health Organization. International Histological Classification of Tumours) F. Schajowicz

During the two decades since the publication of the first edition of Histological Typing of Bone Tumours, new methods of diagnosis, especially radiological imaging techniques (computed tomography and magnetic resonance imaging), associated with advances in the new cytomorphological methods including immunohistochemistry, DNA ploidy analysis, cytogenetic chromosomal investigation, etc., have greatly improved our diagnostic tools and treatment results. These advances are reflected by the publication of new editions of various important textbooks in recent years. In these publications classification criteria differed. In contrast, the WHO classification has been relatively unaltered, and has introduced a limited number of new entities and subdivided others because of distinct histological features and biological behaviour. In general the framework and the concept of the original classification, as it has been widely accepted, remains essentially unchanged. The classification is based on the line of histological differentiation, in many instances reflecting the type of intercellular matrix material produced. This approach is justified because it avoids theoretical histogenetic controversies.
